DART1033 | Interactive Media

Project brief

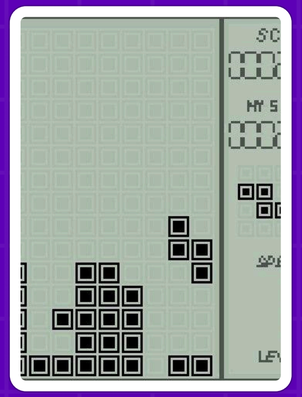

This project is a personal portfolio website designed to showcase my work in illustration, animation, interactive media, and web design. The goal is to create an engaging platform that reflects my creative identity while allowing visitors to easily explore different projects. The website is developed using HTML, CSS, and JavaScript, combining visual storytelling with interactive elements to create an enjoyable browsing experience.

Concept statement

The portfolio is inspired by retro puzzle and arcade games such as Tetris, combining bold typography, bright colors, hand-drawn illustrations, and layered 2D graphics. The block-based visual language represents how different ideas, skills, and mediums can come together to create something new. Through this playful and dynamic approach, the portfolio reflects my creativity, experimentation, and continuous growth as a designer.

MOOBOARD ANALYSIS

The visual direction is inspired by Tetris and other retro games, particularly their playful interfaces, block-based elements, and nostalgic game aesthetics.

Style: Retro gaming, pixel art, digital illustration
Colour: Vibrant purple with bright, high-contrast accents
Layout: Asymmetrical, modular, block-based composition
Graphics: Bold outlines, pixelated UI, layered 2D elements
Mood: Playful, energetic, nostalgic, experimental

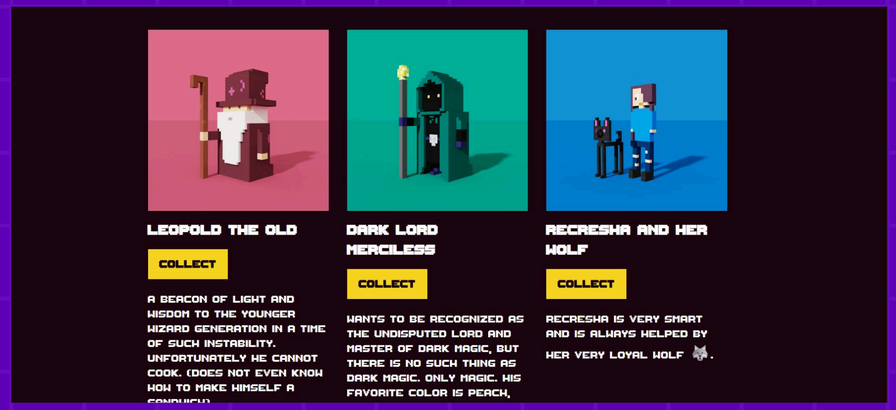

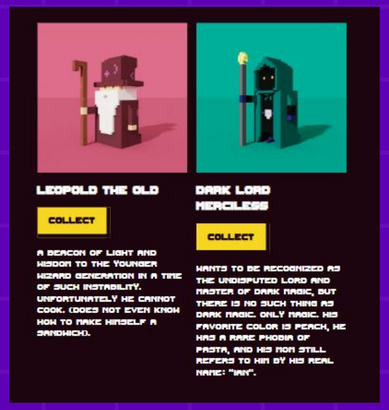

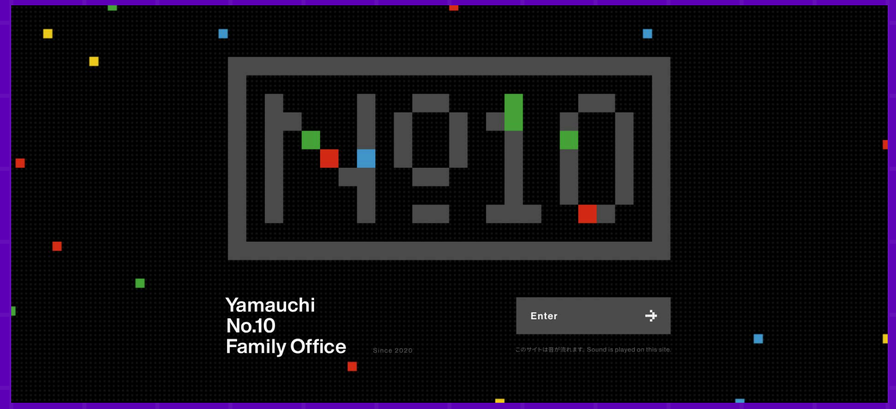

Responsive Strategy Inspirations

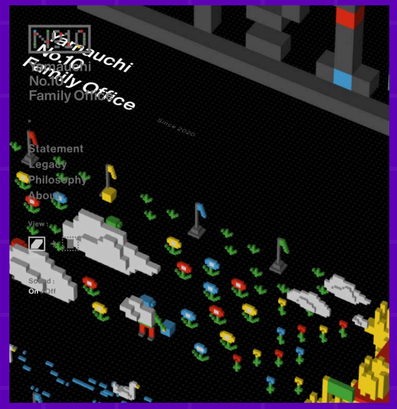

www.wizardshock.xyz

I was inspired by how Wizardshock arranges its elements and creates a clear visual hierarchy, using different sizes, positions, and layers to guide the viewer through the website while keeping the layout playful and dynamic.

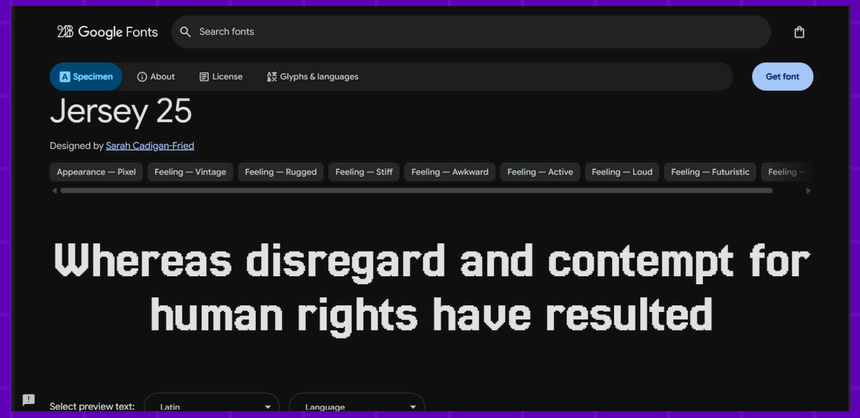

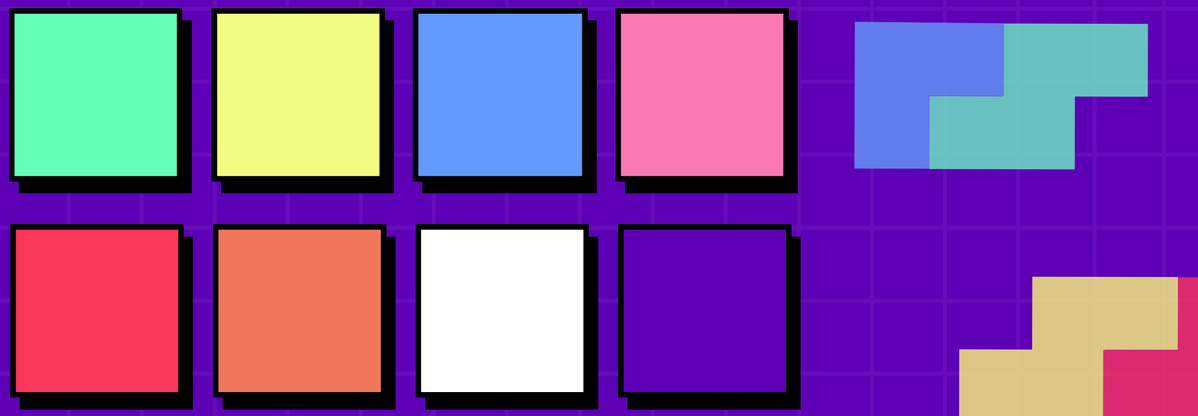

Yamauchi No.10 Family Office

For my website, I applied a similar approach by rearranging and scaling the decorative elements across different screen sizes, while keeping the playful, retro-game aesthetic and overall consistent.

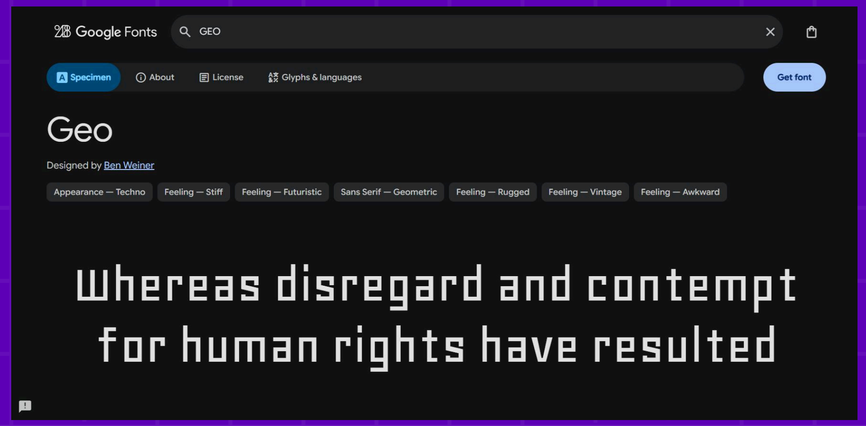

Typography & Color Palatte

Jersey 25 - used for headings and key titles

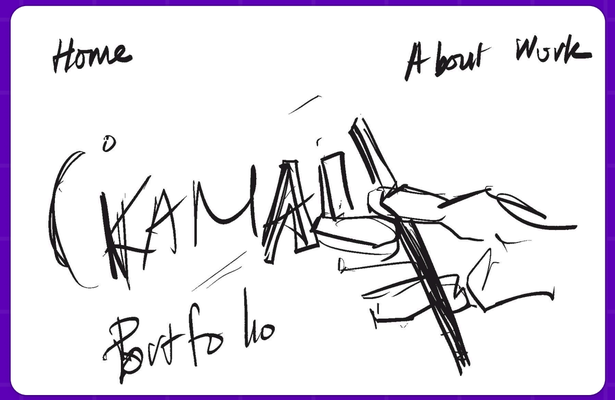

GEO - used for body text

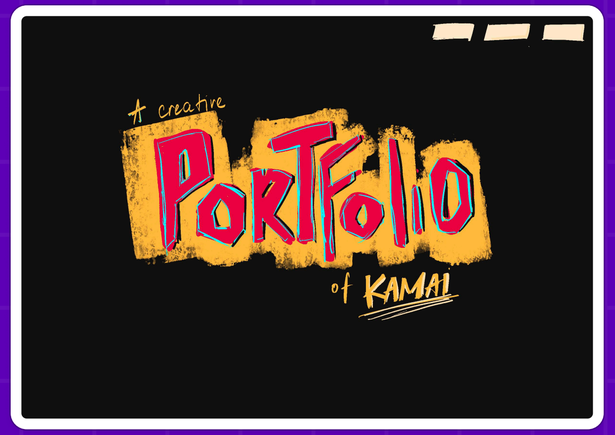

Learning from Assignment 1, I paid more attention to typography and colour. Jersey 25 is used for headings because its bold, pixel-inspired style fits the game aesthetic, while Geo is used for body text for better readability. The colour palette includes pink, orange, yellow, red, blue, cyan, white, and purple, creating a playful and energetic retro-game style while keeping the project visually consistent.

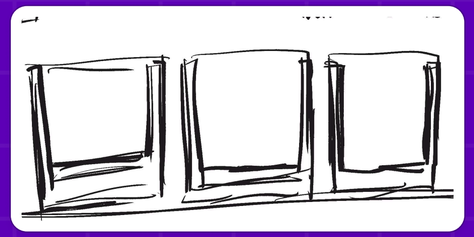

Sketches

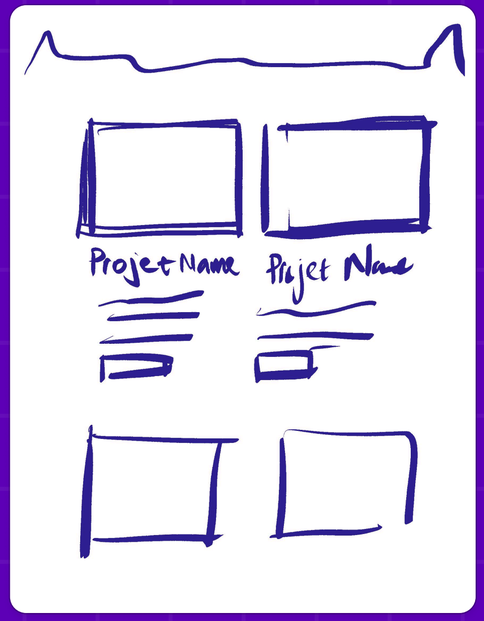

Home page

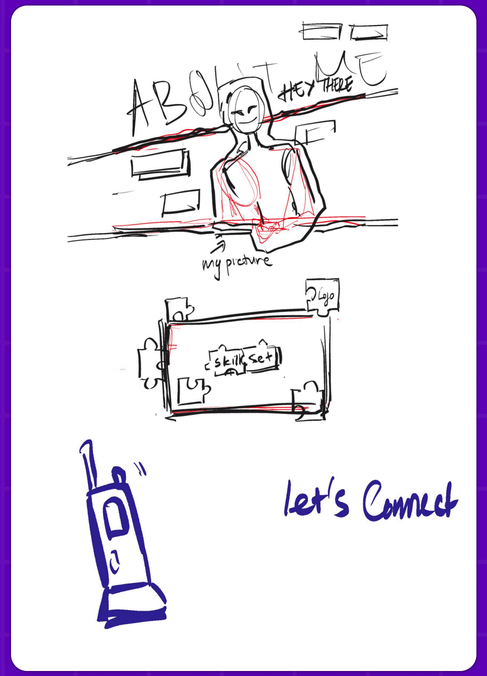

Work page

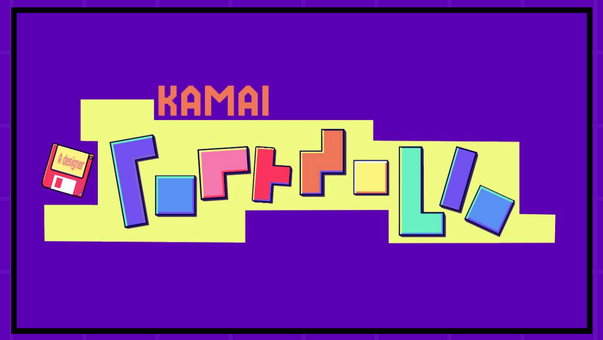

About page

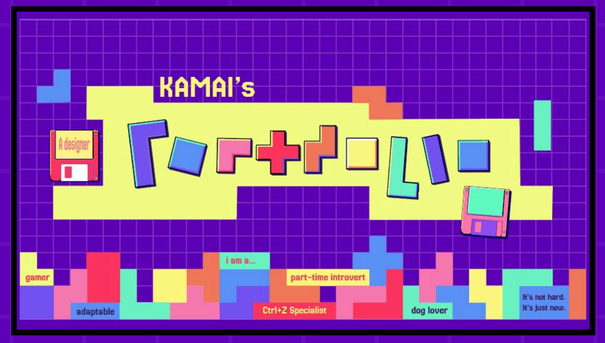

So far, the layout and initial ideas remain quite similar to my first version. I made a few adjustments along the way to improve the overall consistency of the design.

Visual development

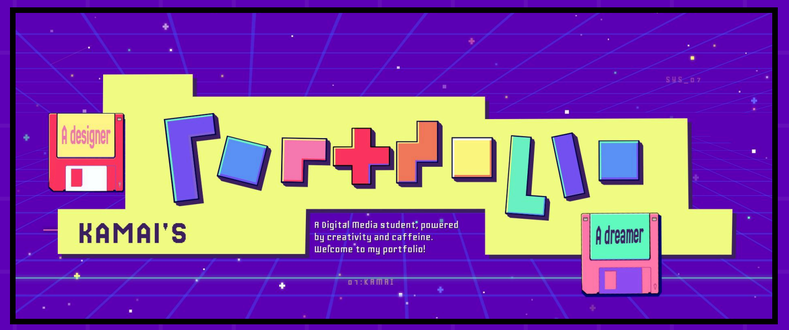

Before

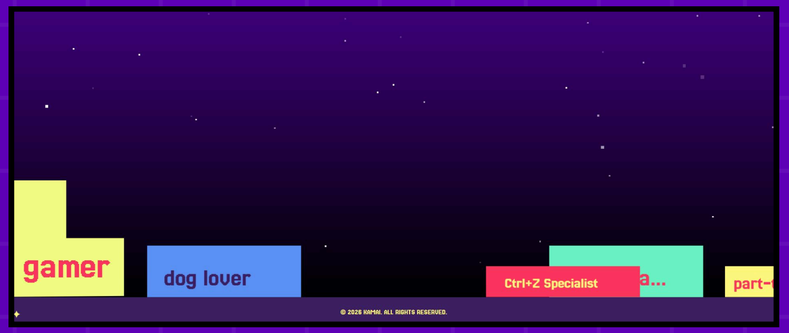

At first, I was quite unsure about the visual direction for the homepage. I used a grid background to reduce the empty space and added a yellow block behind the "Portfolio" text to make the title stand out.

After

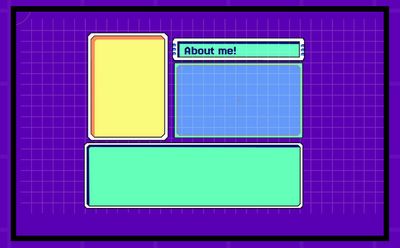

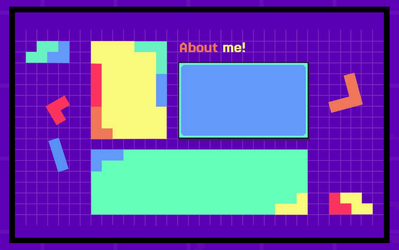

I later replaced the Illustrator grid with a CSS-based grid for better responsiveness. I also added button interactions, descriptions, and personality blocks to make the homepage more engaging and personal.

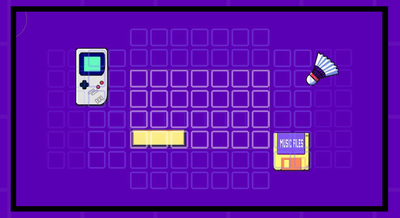

HOME PAGE

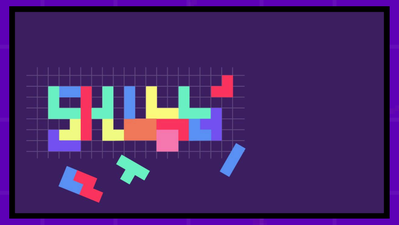

Visual development

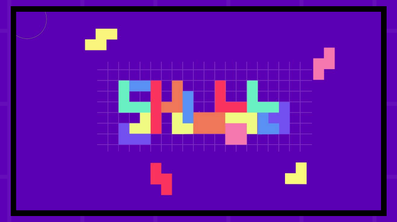

Before

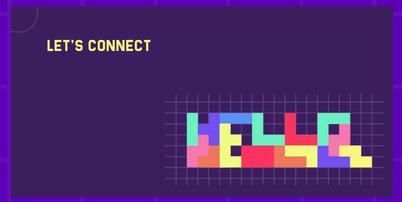

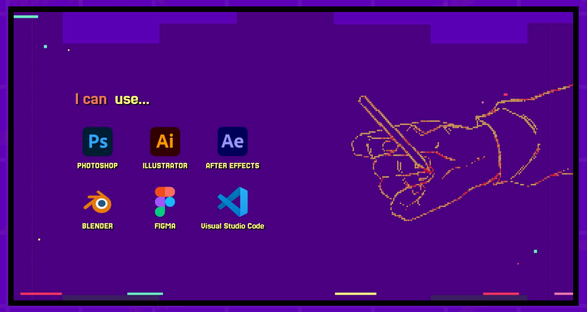

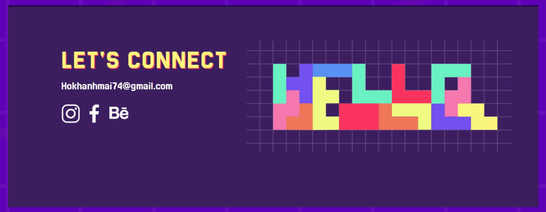

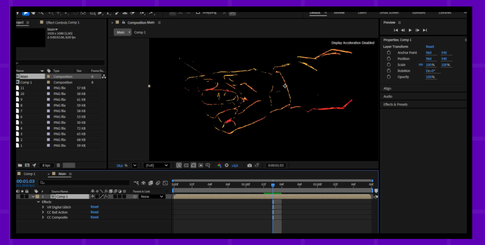

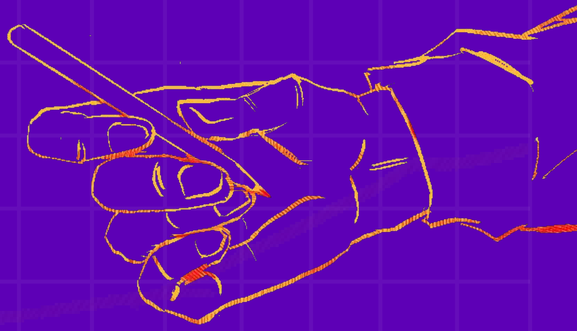

After

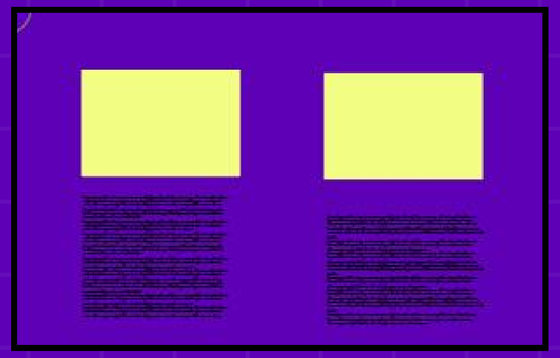

My initial idea was to create a game-like player stats page with a section for my personal interests. Due to responsive issues, I combined my short introduction into the inventory. For the skills section, I first experimented with Tetris blocks to form the word “SKILL”, but it was difficult to recognise, so I changed the approach and added a hand GIF to make the section more dynamic.

ABOUT ME

Visual development

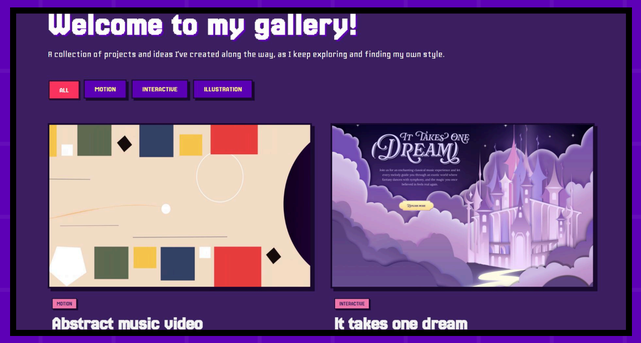

Before

After

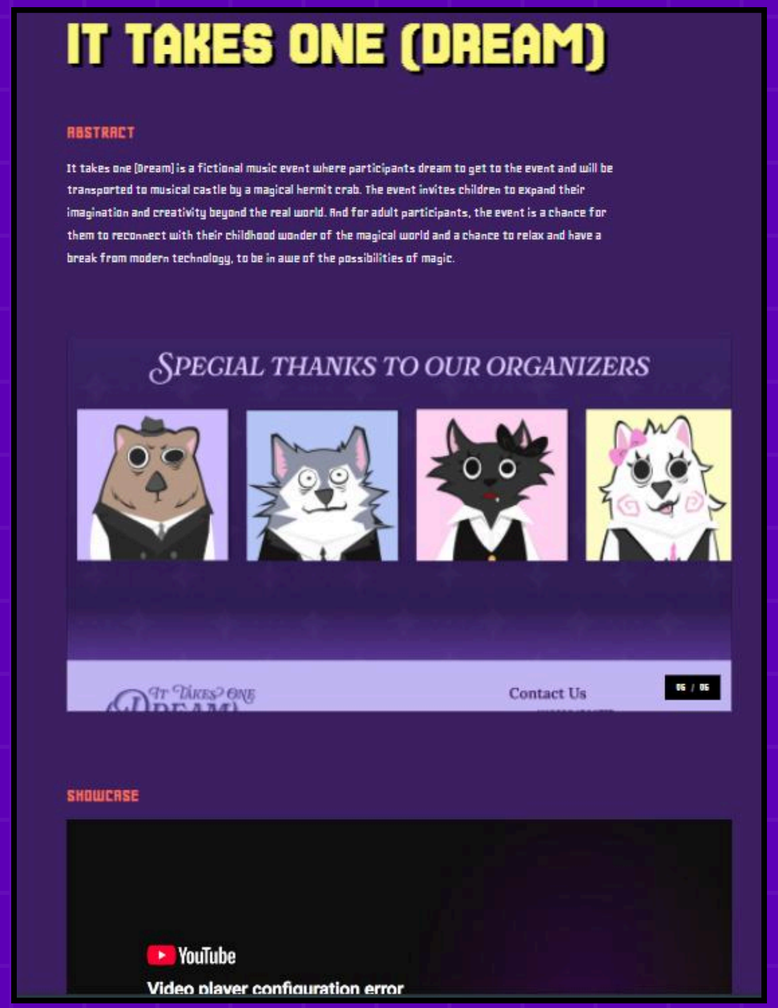

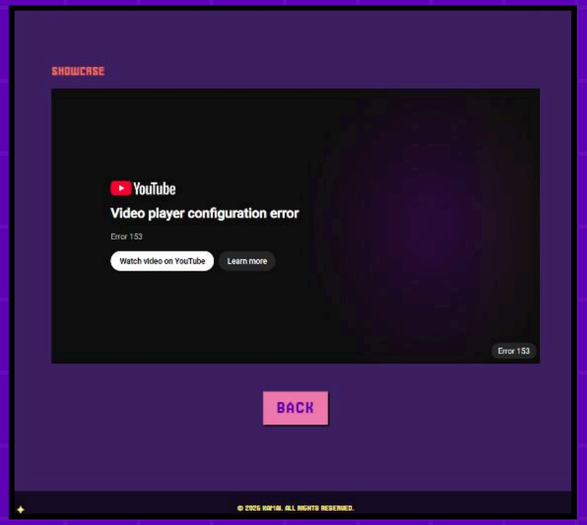

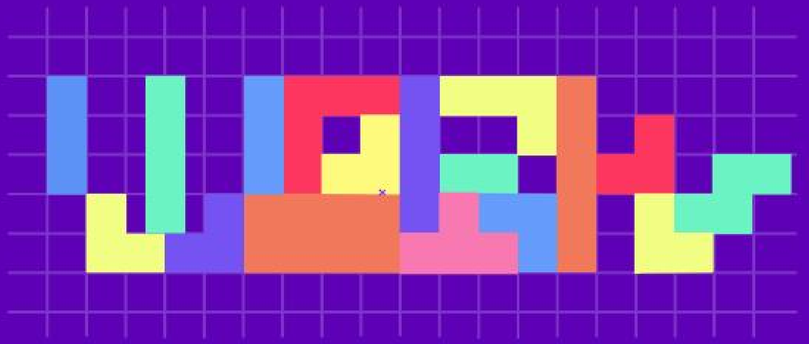

For the Work page, I wanted to make the background feel more dynamic and connected to the overall retro-game aesthetic. I added glitch, star, and spark effects to create more movement and visual interest without distracting from the projects. I also created category buttons to organise my work, making it easier for users to explore different types of projects.

WORK PAGE

Visual development

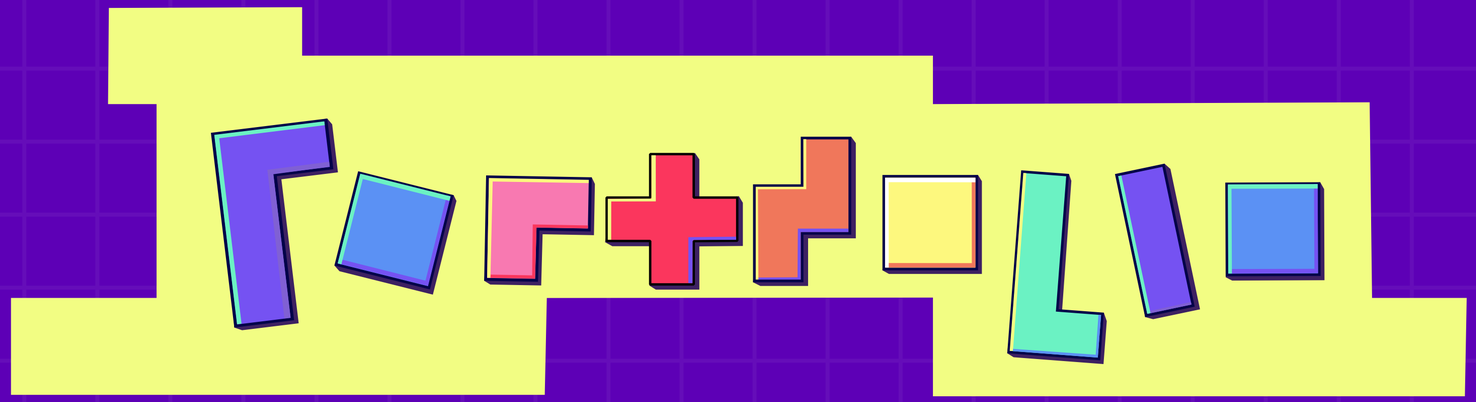

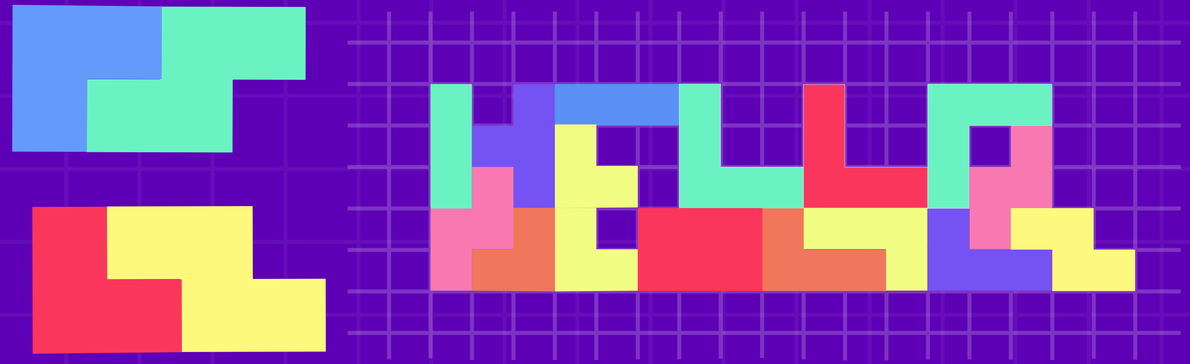

Each project also has its own dedicated page, allowing me to present the work in more detail rather than showing everything on the main Work page. This gives each project its own space to showcase the visuals, and concept, while keeping the overall Work page clean and easy to navigate.

Project showcase

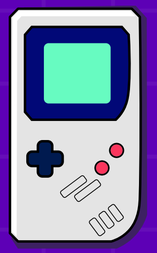

Elements

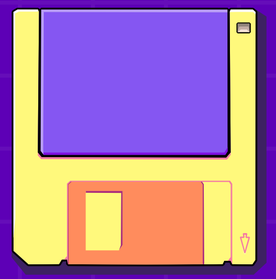

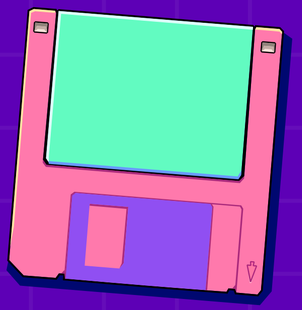

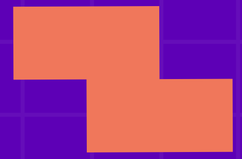

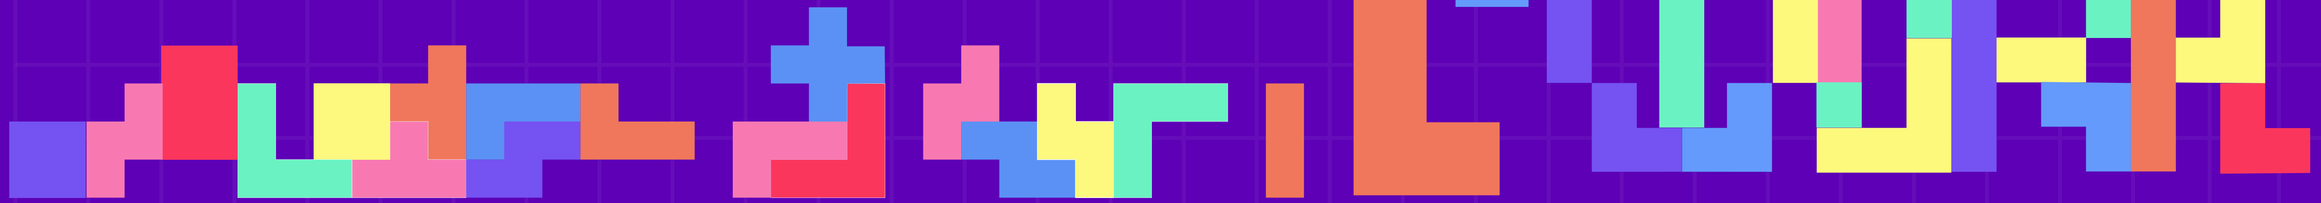

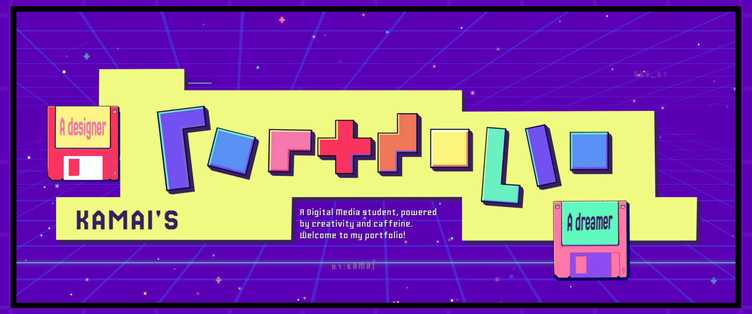

Coding Iteration

Stars

```
//star sec 1
const starsContainer = document.querySelector(".hero .stars");

const STAR_COUNT = 70;

for (let i = 0; i < STAR_COUNT; i++) {

    const star = document.createElement("div");
    star.classList.add("star");

    star.style.left = Math.random() * 100 + "%";
    star.style.top = Math.random() * 100 + "%";

    const size = Math.random() < 0.75
        ? 3
        : Math.random() * 5 + 3;

    star.style.width = size + "px";
    star.style.height = size + "px";

    star.style.setProperty(
        "--moveX",
        (Math.random() * 30 - 15) + "px"
    );

    star.style.setProperty(
        "--moveY",
        (Math.random() * 30 - 15) + "px"
    );

    star.style.setProperty(
        "--duration",
        (4 + Math.random() * 3) + "s"
    );

    star.style.setProperty(
        "--blink",
        (2 + Math.random() * 4) + "s"
    );

    star.style.animationDelay =
        Math.random() * 3 + "s";

    starsContainer.appendChild(star);
}
```

Sparks

```
//SPARKS
const sparks = document.querySelector(".sparks");
const glitchLines = document.querySelector(".glitch-lines");
const bgEffects = document.querySelector(".bg-effects");
const sparkColors = [
    "#fef87e",
    "#6bf3c3",
    "#f07aae",
    "#6c63ff",
    "#ffffff"
];
/* ================================================
   CREATE SPARKS
================================================ */

for (let i = 0; i < 90; i++) {
    const spark = document.createElement("span");
    spark.classList.add("spark");
    /* random size */
    if (Math.random() > 0.8) {
        spark.classList.add("big");
    }
    /* random cross */
    if (Math.random() > 0.88) {
        spark.classList.add("cross");
    }
    spark.style.left =
        Math.random() * 100 + "%";

    spark.style.top =
        Math.random() * 100 + "%";
    spark.style.color =
        sparkColors[
            Math.floor(
                Math.random() * sparkColors.length
            )
        ];

    spark.style.background =
        spark.style.color;

    spark.style.setProperty(
        "--duration",
        (1.5 + Math.random() * 4) + "s"
    );

    spark.style.setProperty(
        "--delay",
        (Math.random() * 4) + "s"
    );

    sparks.appendChild(spark);
```

For the background, I work with ChatGPT to create a pixel-style star background. I chose stars mainly because I personally like them, but they also work well with the overall retro-game aesthetic of the portfolio. The stars help fill the empty space while adding a sense of depth and atmosphere without taking too much attention away from the main content. I then adapted the visual to fit the overall style and consistency of the website.

Glitch

```
/* ================================================
   CREATE GLITCH LINES
================================================ */

for (let i = 0; i < 40; i++) {

    const glitch =
        document.createElement("span");

    glitch.classList.add("glitch");

    glitch.style.top =
        Math.random() * 80 + "%";

    glitch.style.left =
        Math.random() * 90 + "%";

    glitch.style.width =
        (20 + Math.random() * 120) + "px";

    glitch.style.background =
        sparkColors[
            Math.floor(
                Math.random() * sparkColors.length
            )
        ];

    glitch.style.setProperty(
        "--duration",
        (2 + Math.random() * 5) + "s"
    );

    glitch.style.setProperty(
        "--delay",
        (Math.random() * 3) + "s"
    );

    glitchLines.appendChild(glitch);
}
```

Pixels

```
/* ================================================
   CREATE FLOATING PIXELS
================================================ */

for (let i = 0; i < 100; i++) {

    const pixel =
        document.createElement("span");

    pixel.classList.add("pixel");

    pixel.style.left =
        Math.random() * 100 + "%";

    pixel.style.top =
        50 + Math.random() * 55 + "%";
    pixel.style.bottom =
        50 + Math.random() * 55 + "%";

    pixel.style.background =
        sparkColors[
            Math.floor(
                Math.random() * sparkColors.length
            )
        ];

    pixel.style.setProperty(
        "--duration",
        (3 + Math.random() * 6) + "s"
    );

    pixel.style.setProperty(
        "--delay",
        (Math.random() * 5) + "s"
    );

    bgEffects.appendChild(pixel);
}
```

Background

Coding Iteration

```css
@media screen and (max-width: 2880px) {
.work-grid {
    width: 100%;

    display: grid;

    grid-template-columns:
        repeat(2, minmax(0, 1fr));

    gap: 70px 45px;
}
/* ======================
   CARD
====================== */

.work-card {
    min-width: 0;

    display: flex;
    flex-direction: column;

    transition:
        opacity 0.2s steps(3),
        transform 0.2s steps(3);
}
/* ======================
   IMAGE
====================== */

.work-image {
    width: 100%;

    aspect-ratio: 16 / 10;

    overflow: hidden;

    background: #5d00b6;

    border: 4px solid #1c0b30;

    box-shadow:
        7px 7px 0 #1c0b30;
}
```

```css
@media screen and (max-width: 480px) {

    .work-sec {
        padding: 70px 18px 70px;
    }

    .works-title {
        font-size: 2.8rem;
    }

    .works-intro {
        margin-bottom: 30px;
        font-size: 0.95rem;
    }

    .work-filter {
        gap: 8px;
        margin-bottom: 40px;
    }

    .filter-btn {
        padding: 9px 14px;
        font-size: 0.85rem;
    }

    .work-grid {
        grid-template-columns: 1fr;

        gap: 50px;
    }

    .work-image {
        box-shadow:
            5px 5px 0 #1c0b30;
    }

    .work-info h2 {
        font-size: 2rem;
    }

    .work-info p {
        font-size: 1rem;
    }
}
```

To improve responsiveness on the Work page, I adjusted the project grid across different screen sizes. The desktop and tablet versions use a two-column layout, while the mobile version switches to a single column. This makes each project easier to view and prevents the layout from feeling too crowded on smaller screens.

Work

Coding Iteration

I combined the Personal Stats section to share some basic information about myself and added an Inventory section to showcase my personal interests. The idea came from seeing how some games use player stats and inventories to introduce their characters.

The transition from the stats to the inventory was probably the most frustrating part. I had a few small "arguments" with ChatGPT while working on the transition and draggable items. Although it was frustrating, the process taught me how to communicate and prompt it more clearly so it could better understand what I wanted.

```
/* STATE 2 → STATE 1 */

backButton.addEventListener("click", () => {

    section1.classList.remove("show-state-2");

});

//INVENTORY
const inventory = document.querySelector(".inventory-2");

const items = inventory.querySelectorAll(
    ".game, .file, .tag, .shuttlecock"
);

items.forEach(item => {

    let isDragging = false;
    let offsetX = 0;
    let offsetY = 0;

    /* ========================
       HOVER
    ======================== */

    item.addEventListener("mouseenter", () => {

        if (!isDragging) {
            item.style.zIndex = "1000";
        }

    });

    item.addEventListener("mouseleave", () => {

        if (!isDragging) {
            item.style.zIndex = "20";
        }

    });
```

```
/* ================================================
   STATE SWITCH
================================================ */

/* STATE 1 → HIDE */

.section1.show-state-2 .inventory-1,
.section1.show-state-2 .click {
    opacity: 0;
    visibility: hidden;
    pointer-events: none;
}

/* STATE 2 → SHOW */

.section1.show-state-2 .inventory-2 {
    opacity: 1;
    visibility: visible;
    pointer-events: auto;
}
/*================================================
DIALOG
================================================*/
.dialog-box {
    position: absolute;
    bottom: -90%;
    left: -10%;
    width: min(770px, 95vw); /* tăng chiều ngang */
    min-height: auto;
    padding: 22px 28px;

    background: #66ffbb;

    font-family: "Jersey 25", sans-serif;

    z-index: 20;

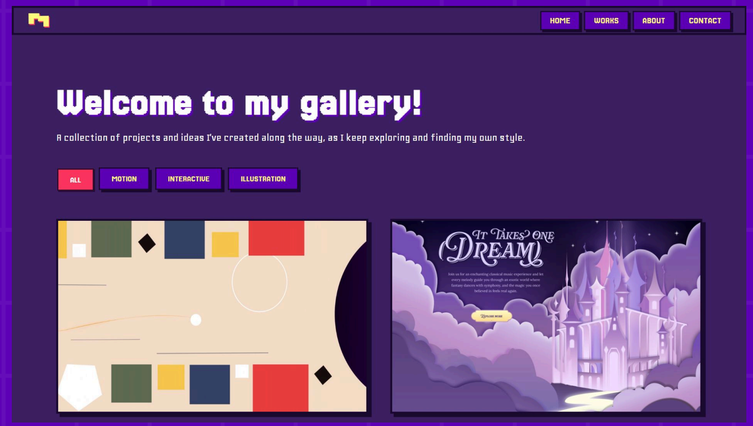

}
```

Reflection

For Assignment 2, I feel that this project was a big step forward for me. Managing my time better meant I did not feel as stressed when the deadline approached. However, I still think I need to work faster, as I realised that I can sometimes be a little lazy with my progress.

This time, I spent more time researching websites and visual directions. At first, I was worried because I could not find a style that felt right, but the research helped me understand different approaches and gradually find a direction that suited my project. Once I had a visual direction, I faced another challenge with responsiveness. This took up the most time, but it taught me that building a website is not just about creating visuals—it is also about making sure the design works across different devices.

I also worked on my Figma designs and VS Code simultaneously, which gave me more opportunities to play around with the code. When I realised that certain elements did not work well on the web, I could quickly explore other solutions. This project improved my coding skills significantly, especially through all the testing and debugging. However, I know I still have a lot more to learn and need to keep practising to become more confident with coding.
